Summary

Software Engineer with 4+ years of experience specializing in the games industry. Specialized in C# (Unity) and C++ (In-house Engines), with a focus on performance optimization, scalable architecture and tooling. Experienced working in cross-functional teams from feature design to release of cross-platform mobile titles (iOS/Android).

Experience

Outfit7 — *Limassol, CY*

Software Engineer — *Sep. 2021 - Present*

- Lead Feature Owner: Architect and implement complex gameplay systems for high-traffic mobile titles using Unity C# and Starlite (proprietary C++ engine), for multi million DAU projects.
- Performance Optimization: Conducted CPU/GPU profiling. Optimized draw calls, memory allocation (GC spikes), and shader complexity to maintain high FPS on low-end devices. Improving business metrics and KPIs.
- LiveOps & Remote Configuration: Architected and managed data-driven features using a Backend (BE) integration layer, enabling real-time scheduling, A/B testing, and remote toggling of game events via Remote Config, removing the need for store resubmissions.
- System Architecture: Responsible for the lifecycle of internal C++ libraries, ensuring robust cross-platform compatibility across iOS and Android.
- Tooling: Developed C# Unity Editor extensions to automate workflows and asset validation, reducing workload and increasing department productivity.
- Code Quality: Participated actively in code reviews, providing technical feedback and enforcing best practices.

Skills & Tools

Programming Languages: C#, C++, HLSL/GLSL, HTML, CSS
Engines & Libraries: Unity, Custom C++ Engines, OpenGL, PhysX, Bullet3D, FMOD.
Technical Specialties: CPU/GPU Profiling and optimization, Unity Profiler, Frame Debugger, RenderDoc, Memory Profiling
Tools & Pipeline: Rider, Visual Studio, Git, CircleCi, Jira.
Languages: Greek, English

Education

University of Newcastle — *Newcastle, UK*

MSc in Computer Games Engineering (Distinction) — *Sep. 2019 - Nov. 2020*

Advanced Programming for Games C++, Advanced Graphics for Games, Advanced game technologies.

University of Reading — *Reading, UK*

BSc in Computer Science (2:1) — *Sep. 2016 - Jul. 2019*

Virtual Reality, Artificial Intelligence, Mathematics for Programming.

Projects

VR for Drug Network visualisation

Virtual Reality - Graph Visualiser (VR-GV) — *Sept. 2020*

- Designed and implemented a VR-based graph visualization tool for large-scale protein interaction datasets.
- Developed custom graph drawing algorithms (force-directed, circular layouts) optimized for real-time interaction.
- Focused on performance optimization to handle large datasets smoothly in VR environments.
- `https://www.youtube.com/watch?v=Yv4q_IP3_2A`

Custom C++ Physics Engine & AI Framework.

Developed a custom physics engine from scratch in C++, implementing: — *Dec. 2019*

- Discrete/continuous collision detection and response
- Raycasts
- Linear and Angular motion
- Quad-tree spatial acceleration structures to optimize broad-phase performance
- Pathfinding algorithms.
- `https://www.youtube.com/watch?v=orvMmOUUNgU`

Rendering engine in C++, OpenGL

Developed a deffered rendering engine in C++ and OpenGL. Demonstration of: — *Nov. 2019*

- Shaders for texture blending, Lighting calculations for ambient diffuse and specular components
- Post processing effects: Blur, Split screen, Sobel's Edge filtering
- Shadow Mapping, Reflections and Cinematic automated Camera movement
- `https://youtube.com/watch?v=kYYkThFDk_4`
